## 9 Warning

9.1. Although Fuji Electric is enhancing product quality and reliability, a small percentage of semiconductor products may become faulty. When using Fuji Electric semiconductor products in your equipment, you are requested to take adequate safety measures to prevent the equipment from causing a physical injury, fire, or other problem if any of the products become faulty. It is recommended to make your design fail-safe, flame retardant, and free of malfunction.

9.2. The products introduced in this Specification are intended for use in the following electronic and electrical equipment which has normal reliability requirements.

- Computers/OA equipments
- Measurement equipments
- Electrical home appliances
- Communications equipment (Terminal devices)
- Machine tools
- Personal equipments
- AV equipments
- Industrial robots
- etc...

9.3. If you need to use a product in this Specification for equipment requiring higher reliability than normal, such as for the equipment listed below, it is imperative to contact Fuji Electric to obtain prior approval. When using these products for such equipment, take adequate measures such as a backup system to prevent the equipment from malfunctioning even if a Fuji's product incorporated in the equipment becomes faulty.

- Transportation equipment (Automotives, Locomotives and ships etc...)
- Backbone network equipment
- Gas alarm, Leakage gas auto breaker
- Burglar alarm, Fire alarm, Emergency equipments etc...
- Traffic-signal control equipment

9.4. Don't use products in this Specification for the equipment requiring strict reliability such as (without limitation)

- Aerospace equipment
- Medical equipment
- Aeronautic equipment
- Submarine repeater equipment
- nuclear control equipment

## 10. General Notice

### 10.1. Preventing ESD Damage

Although the gate oxide of Fuji Power MOSFETs is much higher ruggedness to ESD damage than small-Signal MOSFETs and CMOS ICs, careful handling of any MOS devices are an important consideration.

- 1) When handling MOSFETs, hold them by the case (package) and don't touch the leads and terminals.
- 2) It is recommended that any handling of MOSFETs is done while used electrically conductive floor and tablemats that are grounded.
- 3) Before touching a MOSFETs terminal, discharge any static electricity from your body and clothes by grounding out through a high impedance resistor (about 1MΩ)
- 4) When soldering, in order to protect the MOSFETs from static electricity, ground the soldering iron or soldering bath through a low impedance resistor.

#### 10.2. Short mode failure / Open mode failure

The MOSFETs may be in the risk of having short mode failure or open mode failure when the applied over voltage, over current or over temperature each specified maximum rating. It is recommended to use the fail-safe equipment or circuit from such possible failures.

#### 10.3. An Electric shock / A Skin burn

You may be in risk for an Electric shock or a Skin burn for directly touching to the leads or package of the MOSFETs while turning on electricity or operating.

#### 10.4. Smoke / Fire

Fuji MOSFETs are made of incombustibility material. However, a failure of the MOSFETs may emit smoke or fire. Also, operating the MOSFETs near any flammable place or material may risk the MOSFETs to emit smoke or fire due to the MOSFETs reach high temperature while operated.

#### 10.5. Corrosion / Erosion

Avoid use or storage of the MOSFETs under the higher humidity, corrosive gases. It will lead the device to corrode and possibly cause the device to fail.

#### 10.6. Radiation field

Don't use of the device under the radiation field since the device is not designed for radiation proofing.

### **11. Notes for Design**

11.1. You must design the MOSFETs to be operated within specified maximum ratings (Voltage, Current, Temperature etc...) which are imperative to prevent possible failure or destruction of the device.

11.2. We recommend to use the protection equipment or safety equipment such as fuse, breaker to prevent the fire or damage in case of unexpected accident may have occurred.

11.3. You must design the MOSFETs within its reliability and lifetime in certain the environment or condition. There is a risk that MOSFETs breakdown earlier than the target lifetime of the your products when MOSFETs was used in the reliability condition excessively. Especially avoid use of the MOSFETs under the higher humidity, corrosive gases.

11.4. We recommend to consider for the temperature rise not only for the Channel but also for the Leads if it designed to large current operation to the MOSFETs.

11.5. We only guarantee the non-repetitive and repetitive Avalanche capability and not for the continuous Avalanche capability which can be assumed as abnormal condition. Please note the device may be destructed from the Avalanche over the specified maximum rating.

## 12. Note on implementation

### 12.1. Soldering

Soldering involves temperatures which exceed the device storage temperature rating. To avoid device damage and to ensure reliability, the following guidelines from the quality assurance standard must be observed.

#### 1) Solder temperature and duration

Solder temperature	Duration
260±5 °C	10±1 seconds
350±10 °C	5±0.5 seconds

2) The device should not be soldered closer than 1mm from the package. (\* through-hole package)

3) When flow soldered, care must be taken to Avoid immersing the package in the solder-bath.

12.2. Please see to the following the Torque reference when mounting the device to heat sink. Excess torque applied to the mounting screw causes damage to the device and weak torque will increase the thermal resistance. Both of these conditions may lead the device to be destructed.

Table 1 : Recommended tightening torques.

Package style	Screw	Recommended tightening torques
TO-220 TO-220F	M3	30 – 50 Ncm
TO-3P TO-3PF TO-247	M3	40 – 60 Ncm
TO-3PL	M3	60 –80 Ncm

12.3. If the heat sink with coarse finish is used, increase in thermal resistance and concentrated force to a point may cause the MOSFETs to be destructed. We recommend in such condition to process the surface of heat sink within  $\pm 50\mu\text{m}$  and use of thermal compound to optimize its efficiency of heat radiation. Moreover, it is important to evenly apply the compound and eliminate any air voids. A simple method is to apply a dot of compound of the appropriate quantity to the center of the case just below the chip mount.

### **13. Notes for Storage**

- 13.1. The MOSFETs should be stored at a standard temperature of 5 to 35 °C and humidity of 45 to 75%RH. If the storage area is very dry, a humidifier may be required. In such a case, use only deionized water or boiled water, since the chlorine in tap water may corrode the leads.
- 13.2. Avoid exposure to corrosive gases and dust.
- 13.3. Rapid temperature changes may cause condensation on the MOSFETs surface. Therefore, store the MOSFETs in a place with few temperature changes.
- 13.4. While in storage, it is important that nothing be loaded on top of the MOSFETs, since this may cause excessive external force on the case.
- 13.5. Store MOSFETs with unprocessed lead terminals. Rust may cause presoldered connections to go bad during later processing.
- 13.6. Use only antistatic containers or shipping bag for storing MOSFETs.

### **14. Additional points**

If you have any question about any portion in this Specification, ask Fuji Electric or its sales agents before using the product. Neither Fuji nor its agents shall be liable for any injury caused by any use of the products not in accordance with instructions set forth herein.
